Abdel - Magid MOHAMED

## REDUCED-ORDER OBSERVERS FOR DESCRIPTOR SYSTEMS*

Summary. In this paper, a reduced-order observer for descriptor system is considered. The given system is decomposed into slow and fast subsystem, and then observers are desingned for each subsystem. The singular value decomposition and the generalized inverses of matrices will be used to design the observers. Ilustrative numerical examples are also given.

## OBSERWATORY ZREDUKOWANEGO RZĘDU DLA UK£ADÓW SINGULARNYCH

Streszczenie. W pracy rozpatrzono obserwatory zredukowanego rzędu dla układów singularnych. Dany układ dekomponowany jest na dwa podukłady, "wolny" i "szybki", a nastepnie dla kaz̀dego $z$ nich projektowany jest oddrielny obserwator.

Przy projektowaniu obserwatorow wykorzystuje się uogolnione macierze odwrotne oraz dekompozycję macierzy z wykorzystaniem wartości singularnych. Podano równiez ilustracyjne przyklady numeryczne.

## НАБЛЮДАТЕЛИ РЕДУЦИРОБАННОЙ СТЕПЕНИ ДЛІЯ СИНГУЛЯРНЫХ СИСТЕМ

Резюме. В равоте рассматриваются наблюдатели редуцированной степени для сингулярных систем. Данная система разбивается ма 2 отдельные подсистемы: "

[^0]"медленную" и "быструю". Для каждои из них отдельно проектируется наблюодатель. Во время проектирования используются обобщенные обратные матрицы и разбиение матриц с использованием сипгуляриых значений. Даны иллюстративные численные примеры.

## 1. INTRODUCTION

Consider the continuous-time descriptor system described by

$$
\begin{align*}
& E \dot{x}=A x+B u  \tag{la}\\
& y=C x \tag{lb}
\end{align*}
$$

where $x \in \mathbf{R}^{\mathbf{n}}$ is the descriptor vector, $\mathbf{u} \in \mathbf{R}^{p}$ is the input vector, and $y \in \mathbf{R}^{\mathrm{m}}$ is the output vector. The matrices $\mathrm{A}, \mathrm{B}$ and C are respectively dimensional and E is square and singular matrix.
Throughout we will assume that:
(a) System (1) is regular, i.e. $\operatorname{det}(s E-A) \neq 0$.
(b) System (1) is generalized observable, which means

$$
\operatorname{rank}\left[\begin{array}{c}
\mathrm{sE}-\mathrm{A}  \tag{2a}\\
\mathrm{C}
\end{array}\right]=\mathrm{n}
$$

for all finite values of $s$, and

$$
\operatorname{rank}\left[\begin{array}{l}
E  \tag{2b}\\
C
\end{array}\right]=n
$$

Descriptor (singular or generalized state space) systems have recently received considerable effort [see, e.g., 5, 6, 7, 9, 10, 14].

The observer design problem for system (1) has been studied by using several approaches [see, e.g. 3, 4, 11, 12, 13].

In this paper a simple method to design reduced-order observers for slow and fast subsystems of the given continuous descriptor system is considered. The suggested procedure does not presuppose the observer structure and is based on the singular value decomposition (SVD) and the generalized inverses of matrices.

## 2. OBSERVER CONSTRUCTION

Under the assumption of regularity, there exist two nonsingular matrices Y and T , such that system (1) is restricted system equivalent (rse) to [2]

$$
\begin{equation*}
\dot{\mathrm{x}}_{1}=\mathrm{A}_{1} \mathrm{x}_{1}+\mathrm{B}_{1} \mathrm{u} \tag{3a}
\end{equation*}
$$

$$
\begin{align*}
& y_{i}=C_{1} x_{1}  \tag{3b}\\
& N \dot{x}_{2}=x_{2}+B_{2} u  \tag{4a}\\
& y_{2}=C_{2} x_{2}  \tag{4b}\\
& y=y_{1}+y_{2}
\end{align*}
$$

where $x \in R^{n 1}, x \in R^{n 2}, n_{1}=\operatorname{deg}|s E-A|, n_{1}+n_{2}=n, x=T\left[\begin{array}{l}x_{1} \\ x_{2}\end{array}\right]$,
$\mathrm{YET}=\operatorname{diag}\left\{\mathrm{I}_{\mathrm{nl}}, \mathrm{N}\right\} ; \mathrm{YAT}=\operatorname{diag}\left\{\mathrm{A}_{1}, \mathrm{I}_{\mathrm{n} 2}\right\} ; \mathrm{YB}=\left[\begin{array}{l}\mathrm{B}_{1} \\ \mathrm{~B}_{2}\end{array}\right]$ and $\mathrm{CT}=\left[\mathrm{C}_{1}, \mathrm{C}_{2}\right]$.

### 2.1. Slow Subsystem Observer

Using the generalized matrix inverses [1], the general solution of (3b) is given by

$$
\begin{equation*}
x_{1}=C_{1}^{g} y_{1}+\left(I_{n 1}-C_{1}^{g} C_{1}\right) f \tag{5}
\end{equation*}
$$

with consistency condition

$$
\begin{equation*}
\left(I_{m}-C_{1} C_{1}^{g}\right) y_{1}=0 \tag{6}
\end{equation*}
$$

where $C_{1}^{g}$ is an $n_{1} \times m$ generalized inverse of $C_{1}$ and $f$ is an $n_{1} \times 1$ vector whose elements are arbitrary functions of time. It should be noted that if $\mathrm{C}_{1}$ has a full row rank, then condition (6) is always satisfied. Let us take the SVD [8] od $C_{1}$ which is

$$
\mathrm{C}_{1}=\mathrm{U}\left[\begin{array}{cc}
\sum_{\mathrm{d}} & 0 \\
0 & 0
\end{array}\right] \mathrm{V}^{\mathrm{T}} ; \text { then } \mathrm{C}_{1}^{\mathrm{g}}=\mathrm{V}\left[\begin{array}{cc}
\sum_{\mathrm{d}}^{-1} & 0 \\
0 & 0
\end{array}\right] \mathrm{U}^{\mathrm{T}}
$$

where $\Sigma_{\mathrm{d}}$ is a $\mathrm{d} \times \mathrm{d}$ nonsingular matrix, $\mathrm{d}=\operatorname{rankC}_{1}$, and U and V are square orthogonal matrices of order $m$ and $n_{1}$ respectively. Letting $V=\left[V_{1}, V 2\right]$, where $V_{2}$ is an $n_{1} \times\left(n_{1}-d\right)$ full column rank matrix, then (5) becomes

$$
\begin{equation*}
x_{1}=C_{1}^{g} y_{1}+V_{2} h \tag{7}
\end{equation*}
$$

where $h=V_{2}^{T} f$ is an ( $\left.n_{1}-d\right)$ vector. Substituting (7) into (3a), yields

$$
\begin{equation*}
V_{2} \dot{h}=A_{1} V_{2} h+A_{1} C_{1}^{g} y_{1}+B_{1} u-C_{1}^{g} \dot{y}_{1} \tag{8}
\end{equation*}
$$

So the generalized matrix inverses can be used to uniquely solve (8), since $\mathrm{V}_{2}$ has full column rank, and then by using the solution with its consistency condition, an observer may be constructed. However, in order to work with matrices of smaller dimensions which reduce and simplify the computational effort, the following manipulation is applied.

Since $V_{2}$ has full column rank, there exists an $n_{1} \times n_{2}$ nonsingular matrix $M$ such that $M V_{2}=\left[\begin{array}{c}M_{1} \\ 0\end{array}\right]$, where $M_{1}$ is an $\left(n_{1}-d\right) x\left(n_{1}-d\right)$ nonsingular matrix. Premultiplying (8) by M, yields

$$
\left[\begin{array}{c}
\mathrm{M}_{1}  \tag{9}\\
0
\end{array}\right] \dot{\mathrm{h}}=\left[\begin{array}{l}
\mathrm{A}_{11} \\
\mathrm{~A}_{12}
\end{array}\right] \mathrm{h}+\left[\begin{array}{l}
\mathrm{P}_{11} \\
\mathrm{P}_{12}
\end{array}\right] \mathrm{y}_{1}+\left[\begin{array}{l}
\mathrm{B}_{11} \\
\mathrm{~B}_{12}
\end{array}\right] \mathrm{u}-\left[\begin{array}{l}
\mathrm{D}_{11} \\
\mathrm{D}_{12}
\end{array}\right] \dot{\mathrm{y}}_{1}
$$

where $A_{11}, B_{11}, D_{11}$ and $P_{11}$ have $\left(n_{1}-d\right)$ rows and $\left(n_{1}-d\right), p,\left(n_{1}-d\right)$ and $m$ columns, respectively. Let us denote

$$
\begin{equation*}
\mathrm{w}_{1}=\mathrm{M}_{1} \mathrm{~h}+\mathrm{D}_{11} \mathrm{y}_{1} \tag{10}
\end{equation*}
$$

Then (9) can be splitted into the follwing two equations

$$
\begin{align*}
& \dot{\mathrm{w}}_{1}=\mathrm{A}_{11} \mathrm{M}_{1}^{-1} \mathrm{w}_{1}+\left(\mathrm{P}_{11}-\mathrm{A}_{11} \mathrm{M}_{1}^{-1} \mathrm{D}_{11}\right) \mathrm{y}_{1}+\mathrm{B}_{11} \mathrm{u}  \tag{11}\\
& \mathrm{~A}_{12} \mathrm{M}_{1}^{-1} \mathrm{w}_{1}=\left(\mathrm{A}_{12} \mathrm{M}_{1}^{-1} \mathrm{D}_{11}-\mathrm{P}_{12}\right) \mathrm{y}_{1}-\mathrm{B}_{12} \mathrm{u}+\mathrm{D}_{12} \dot{\mathrm{y}}_{1} \tag{12}
\end{align*}
$$

Equations (11) and (12) can ben interpreted as a dynamical system, where $\mathrm{w}_{1}$ is the state vector, $\left[\begin{array}{c}y_{1} \\ u\end{array}\right]$ is the input vector and the right hand side of (12) is the output vectore.

An observer of order ( $\left.n_{1}-d\right)$ can be initially constructed for system (11) and (12) as follows

$$
\begin{align*}
& \dot{\bar{w}}_{1}=\left(A_{11} M_{1}^{-1}-K_{1} A_{12} M_{1}^{-1}\right) \bar{w}_{1}+ \\
& +\left(\mathrm{P}_{11}-\mathrm{A}_{11} \mathrm{M}_{1}^{-1} D_{11}+\mathrm{K}_{1} A_{12} M_{1}^{-1} D_{11}-K_{1} \mathrm{P}_{12}\right) \mathrm{y}_{1}+  \tag{13}\\
& +\left(\mathrm{B}_{11}-\mathrm{K}_{1} \mathrm{~B}_{12}\right) \mathrm{u}+\mathrm{K}_{1} \mathrm{D}_{12} \dot{\mathrm{y}}_{1}
\end{align*}
$$

where $K_{1}$ is a $\left(n_{1}-d\right) x d$ arbitrary matrix which must be chosen such that the matrix $\left(\mathrm{A}_{11} \mathrm{M}_{1}^{-1}-\mathrm{K}_{1} \mathrm{~A}_{12} \mathrm{M}_{1}^{-1}\right)$ has arbitrarily specified eigenvalues. Clearly, this can be done if and only if the pair od matrices $\left(A_{12} M_{1}^{-1}, A_{11} M_{1}^{-1}\right)$ is observable [15]. Theorem 1: If system (1) satisfies observability condition (2a), then $\left(\mathrm{A}_{12} \mathrm{M}_{1}^{-1}, \mathrm{~A}_{11} \mathrm{M}_{1}^{-1}\right)$ is observable pair of matrices.
Proof: Using suitable matrix operation non (2a), yields

$$
\begin{aligned}
& n=n_{1}+n_{2}=\operatorname{rank}\left[\begin{array}{cc}
Y & O \\
O & I_{m}
\end{array}\right]\left[\begin{array}{c}
s E-A \\
C
\end{array}\right][T]=\operatorname{rank}\left[\begin{array}{cc}
s I_{n 1}-A_{1} & O \\
O & s N-I_{n 2} \\
C_{1} & C_{2}
\end{array}\right] \\
& =\operatorname{rank}\left[\begin{array}{ccc}
I_{n 1} & O & 0 \\
0 & I_{n 2} & O \\
O & O & U^{T}
\end{array}\right]\left[\begin{array}{cc}
s_{n 1}-A_{1} & O \\
O & s N-I_{n 2} \\
U\left[\begin{array}{cc}
\sum_{d} & 0 \\
O & 0
\end{array}\right] V^{T} & C_{2}
\end{array}\right]\left[\begin{array}{cc}
V & O \\
O & I_{n 2}
\end{array}\right] \\
& =\operatorname{rank}\left[\begin{array}{cc}
\left(\mathrm{sI}_{\mathrm{n} 1}-\mathrm{A}_{1}\right) \mathrm{V} & 0 \\
0 & \mathrm{sN}-\mathrm{I}_{\mathrm{n} 2} \\
{\left[\begin{array}{cc}
\sum_{\mathrm{d}} & 0 \\
\mathrm{O} & 0
\end{array}\right]} & \mathrm{C}_{2}
\end{array}\right]
\end{aligned}
$$

Notcing the fact that ( $\mathrm{s} N-\mathrm{In} 2$ ) is invertible for any finite s ,
$\operatorname{rank}\left[\begin{array}{cc}\left(\operatorname{sI}_{n l}-A_{1}\right) V \\ {\left[\begin{array}{cc}\sum_{d} & 0\end{array}\right]}\end{array}\right]=n_{1}=\operatorname{rank}\left[\begin{array}{cc}\left(\mathrm{sI}_{\mathrm{nl}}-\mathrm{A}_{1}\right) V_{1} & \left(\mathrm{sI}_{\mathrm{nl}}-\mathrm{A}_{1}\right) V_{2} \\ \sum_{\mathrm{d}} & O\end{array}\right]$
Consequently,
$\operatorname{rank}\left(\operatorname{sI}_{\mathrm{n} 1}-A_{1}\right) V_{2}=n_{1}-d=\operatorname{rank}[M]\left(\mathrm{sI}_{\mathrm{n} 1}-A_{1}\right) V_{2}=\operatorname{rank}\left[\begin{array}{c}s \mathrm{M}_{1}-A_{11} \\ -A_{12}\end{array}\right]$
Then $\left(A_{11} M_{1}^{-1}, A_{12} M_{1}^{-1}\right)$ is observable pair of matrices.
Returning to (13), the derivative of $y_{1}$, can be eliminated by defining another new variable as follows

$$
\begin{equation*}
z_{1}=\bar{w}_{1}-K_{1} D_{12} Y_{1} \tag{14}
\end{equation*}
$$

and then the final form of (13) may be written as

$$
\begin{equation*}
\dot{z}_{1}=\mathrm{F}_{1} \mathrm{z}_{1}+\mathrm{G}_{1} \mathrm{y}_{\mathrm{i}}+\mathrm{S}_{1} \mathrm{u} \tag{15}
\end{equation*}
$$

where

$$
\begin{gathered}
\mathrm{F}_{1}=A_{11} M_{1}^{-1}-K_{1} A_{12} M_{1}^{-1} \\
G_{1}=P_{11}-A_{11} M_{1}^{-1} D_{11}-K_{1} P_{12}+K_{1} A_{12} M_{1}^{-1} K_{1} D_{12}-K_{1} A_{12} M_{1}^{-1} K_{1} D_{12} \\
S_{1}=B_{11}-K_{1} B_{12}
\end{gathered}
$$

Also, the estimated state $\hat{x}_{1}$ can be obtained by using (7), (10), and (14) as follows

$$
\begin{equation*}
\hat{x}_{1}=V_{2} M_{1}^{-1} z_{1}+\bar{R}_{1} y_{1} \tag{16}
\end{equation*}
$$

where $\bar{R}_{1}=\left(C_{1}^{g}-V_{2} M_{1}^{-1} D_{11}+V_{2} M_{1}^{-1} K_{1} D_{12}\right)$
This completes the observer construction for the slow subsystem.

### 2.2. Fast Subsystem Observer

Here, the above procedure will be repeated with some differences to desing the observer. Using again, the generalized matrix inverses, the general solution of (4b) is given by

$$
\begin{equation*}
\mathrm{x}_{2}=\mathrm{C}_{2}^{\mathrm{g}} \mathrm{y}_{2}\left(\mathrm{I}_{\mathrm{n} 2}-\mathrm{C}_{2}^{\mathrm{g}} \mathrm{C}_{2}\right) \gamma \tag{17}
\end{equation*}
$$

with consistency condition

$$
\begin{equation*}
\left(I_{m}-C_{2} C_{2}^{g}\right) y_{2}=0 \tag{18}
\end{equation*}
$$

where $C_{2}^{g}$ is an $n_{2} \times m$ generalized inverse of $C_{2}$ and $\gamma$ is an $n_{2} \times I$ arbitrary vector. Let us take the SVD of $\mathrm{C}_{2}$ which is

$$
\mathrm{C}_{2}=\mathrm{P}\left[\begin{array}{cc}
\Sigma_{1} & 0 \\
0 & 0
\end{array}\right] \mathrm{Q}^{\mathrm{T}} \text {; then } \mathrm{C}_{2}^{\mathrm{g}}=\mathrm{Q}\left[\begin{array}{cc}
\Sigma_{1}^{-1} & 0 \\
0 & 0
\end{array}\right] \mathrm{P}^{\mathrm{T}}
$$

where $1=$ rank $C_{2}$. Letting $Q=\left[Q_{1}, Q_{2}\right]$ where $Q_{2}$ is an $n_{2} \times\left(n_{2}-1\right)$ full column rank matrix, then (17) becomes

$$
\begin{equation*}
x_{2}=C_{2}^{g} y_{2}+Q_{2} \sigma \tag{19}
\end{equation*}
$$

where $\sigma=Q_{2}^{T} \gamma$ is an ( $\left.n_{2}-1\right) x$ vector. Substituting of (19) into (4a), yields

$$
\begin{equation*}
\mathrm{NQ}_{2} \dot{\sigma}=\mathrm{Q}_{2} \sigma+\mathrm{C}_{2}^{\mathrm{g}} \mathrm{y}_{2}+\mathrm{B}_{2} \mathrm{u}-\mathrm{NC}_{2}^{\mathrm{g}} \dot{\mathrm{y}}_{2} \tag{20}
\end{equation*}
$$

Equation (20) can be uniquely solved for $\dot{\sigma}$ if and only if the matrix $\mathrm{NQ}_{2}$ has full column rank.

Theorem 2: If system (1) satisfies condition (2b), then the matrix $\mathrm{NQ}_{2}$ has full column rank equal to ( $\mathrm{n}_{2}-1$ ).
Proof: Using suitable matrix operations on (2b), we get

$$
\begin{aligned}
& \mathrm{n}=\mathrm{n}_{1}+\mathrm{n}_{2}=\operatorname{rank}\left[\begin{array}{l}
\mathrm{E} \\
\mathrm{C}
\end{array}\right]=\operatorname{rank}\left[\begin{array}{cc}
\mathrm{Y} & \mathrm{O} \\
\mathrm{O} & \mathrm{I}_{\mathrm{M}}
\end{array}\right]\left[\begin{array}{l}
\mathrm{E} \\
\mathrm{O}
\end{array}\right][\mathrm{T}]= \\
& =\operatorname{rank}\left[\begin{array}{ccc}
\mathrm{I}_{\mathrm{n}_{1}} & \mathrm{O} & \mathrm{O} \\
\mathrm{O} & \mathrm{I}_{\mathrm{n}_{2}} & \mathrm{O} \\
-\mathrm{C}_{1} & \mathrm{O} & \mathrm{I}_{\mathrm{m}}
\end{array}\right]\left[\begin{array}{cc}
\mathrm{I}_{\mathrm{n} 1} & 0 \\
\mathrm{O} & \mathrm{~N} \\
\mathrm{C}_{1} & \mathrm{C}_{2}
\end{array}\right]=\mathrm{n}_{1}+\operatorname{rank}\left[\begin{array}{c}
\mathrm{N} \\
\mathrm{C}_{2}
\end{array}\right]
\end{aligned}
$$

Then, $n_{2}=\operatorname{rank}\left[\begin{array}{c}N \\ C_{2}\end{array}\right]=$
$=\operatorname{rank}\left[\begin{array}{cc}I_{n_{2}} & 0 \\ 0 & P^{T}\end{array}\right]\left[P\left[\begin{array}{cc}\Sigma_{1} & \mathrm{O} \\ \mathrm{O} & \mathrm{O}\end{array}\right] \mathrm{Q}^{\mathrm{T}}\right][\mathrm{Q}]=\operatorname{rank}\left[\begin{array}{cc}\mathrm{NQ}_{1} & \mathrm{NQ}_{2} \\ \Sigma_{1} & \mathrm{O}\end{array}\right]$
Obviously, rank $\mathrm{NQ}_{2}=\mathrm{n}_{2}-\mathrm{I}$, which completes the proof.
Since $\mathrm{NQ}_{2}$ has full column rank matrix, then there exists a nonsingular $\mathrm{n}_{2} \mathrm{xn}_{2}$ matrix H such that $\mathrm{HNQ}_{2}=\left[\begin{array}{c}\mathrm{H}_{1} \\ 0\end{array}\right]$ where $\mathrm{H}_{1}$ is an $\left(\mathrm{n}_{2}-1\right) \mathrm{x}\left(\mathrm{n}_{2}-1\right)$ nonsingular matrix. Premultiplying (20) by $H$ and letting $\mathrm{HQ}_{2}=\left[\begin{array}{l}\mathrm{A}_{21} \\ \mathrm{~A}_{22}\end{array}\right], \mathrm{HB}_{2}=\left[\begin{array}{l}\mathrm{B}_{21} \\ \mathrm{~B}_{22}\end{array}\right]$, $\mathrm{HC}_{2}^{\mathrm{g}}=\left[\begin{array}{l}\mathrm{P}_{21} \\ \mathrm{P}_{22}\end{array}\right]$, and $\mathrm{HNC}_{2}^{\mathrm{g}}=\left[\begin{array}{l}\mathrm{D}_{21} \\ \mathrm{D}_{22}\end{array}\right]$, where $\mathrm{A}_{21}, \mathrm{~B}_{21}, \mathrm{D}_{21}$ and $\mathrm{P}_{21}$ have $\left(\mathrm{H}_{2}-1\right)$ rows and appropriate number of colums, then the following observer can be obtained after direct substitutions

$$
\begin{equation*}
\dot{z}_{2}=\mathrm{F}_{2} \mathrm{z}_{2}+\mathrm{G}_{2} \mathrm{y}_{2}+\mathrm{S}_{2} \mathrm{u} \tag{21}
\end{equation*}
$$

where

$$
\begin{gathered}
\mathrm{F}_{2}=\mathrm{A}_{21} \mathrm{H}_{1}^{-1}-\mathrm{K}_{2} \mathrm{~A}_{22} \mathrm{H}_{1}^{-1} \\
\mathrm{G}_{2}=\mathrm{P}_{21}-\mathrm{A}_{21} \mathrm{H}_{1}^{-1} \mathrm{D}_{21}-\mathrm{K}_{2} \mathrm{P}_{22}+\mathrm{K}_{2} \mathrm{~A}_{22} \mathrm{H}_{1}^{-1} \mathrm{D}_{21}+ \\
+\mathrm{A}_{21} \mathrm{H}_{1}^{-1} \mathrm{~K}_{2} \mathrm{D}_{22}-\mathrm{K}_{2} \mathrm{~A}_{22} \mathrm{H}_{1}^{-1} \mathrm{~K}_{2} \mathrm{D}_{22}
\end{gathered}
$$

$$
S_{2}=B_{21}-K_{2} B_{22}
$$

Here $\mathrm{K}_{2}$ is an $\left(\mathrm{n}_{2}-1\right) \mathrm{xl}$ arbitrary matrix and can be selected such that the matrix $\mathrm{F}_{2}$ has arbitrarily specified eigenvalues. Clearly, this can be done if and only if $\left(\mathrm{A}_{22} \mathrm{H}_{1}^{-1}, \mathrm{~A}_{21} \mathrm{H}_{1}^{-1}\right)$ is observable pair of matrices. This can be easily proved. Also the estimated vector $\hat{\mathrm{x}}_{2}$ can be found as

$$
\begin{equation*}
\hat{\mathrm{x}}_{2}=\mathrm{Q}_{2} \mathrm{H}_{1}^{-1} \mathrm{z}_{2}+\overline{\mathrm{R}}_{2} \mathrm{y}_{2} \tag{22}
\end{equation*}
$$

where $\overline{\mathrm{R}}_{2}=\left(\mathrm{C}_{2}^{\mathrm{g}}-\mathrm{Q}_{2} \mathrm{H}_{1}^{-1} \mathrm{D}_{21}+\mathrm{Q}_{2} \mathrm{H}_{1}^{-1} \mathrm{~K}_{2} \mathrm{D}_{22}\right)$
This completes the observer construction for the fast subsystem.

## 3. ILLUSTRATIVE EXAMPLES

## Example 1

Consider the follwing descriptor system [11]

$$
\begin{gathered}
{\left[\begin{array}{llll}
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 0
\end{array}\right] \dot{x}=\left[\begin{array}{cccc}
-1 & 1 & 0 & 0 \\
-1 & - & -1 & 1 \\
0 & -1 & -1 & 0 \\
0 & 0 & -1 & 1
\end{array}\right] x+\left[\begin{array}{cc}
1 & 0 \\
0 & 1 \\
0 & 0 \\
1 & 0
\end{array}\right] u ;} \\
y=\left[\begin{array}{llll}
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 1
\end{array}\right] x
\end{gathered}
$$

Using the method of [5], we get

$$
\dot{x}_{1}=\left[\begin{array}{ccc}
-1 & 1 & 0 \\
-1 & 0 & 0 \\
0 & -1 & -1
\end{array}\right] x_{1}+\left[\begin{array}{cc}
1 & 0 \\
-1 & 1 \\
0 & 0
\end{array}\right] u ; \quad y_{1}=\left[\begin{array}{lll}
0 & 0 & 1 \\
0 & 0 & 1
\end{array}\right] x_{1}
$$

and

$$
0=x_{2}\left[\begin{array}{ll}
1 & 0
\end{array}\right] u ; y_{2}=\left[\begin{array}{l}
0 \\
1
\end{array}\right] \mathrm{x}_{2}
$$

Letting, $u=\left[\begin{array}{l}u_{1} \\ u_{2}\end{array}\right], x_{2}=-u_{1}$, and $y_{1}=y-y_{2}$ are known.
Thus, in this system observer only for slow subsystem is necessary. Its output equation can take the following form

$$
y_{11}=\left[\begin{array}{lll}
0 & 0 & 1
\end{array}\right] x_{1}
$$

with $y_{1}=\left[\begin{array}{ll}y_{11} & y_{12}\end{array}\right]^{T}$ and $y_{11}=y_{12}$.
The direct calculation gives

$$
\begin{gathered}
\mathrm{V}_{2}=\left[\begin{array}{ll}
0 & 1 \\
1 & 0 \\
0 & 0
\end{array}\right] ; \mathrm{M}_{1}=\mathrm{I}_{2} ; \mathrm{A}_{11}=\left[\begin{array}{cc}
0 & -1 \\
1 & -1
\end{array}\right] ; \quad \mathrm{A}_{12}=\left[\begin{array}{ll}
-1 & 0
\end{array}\right] ; \quad \mathrm{B}_{11}=\left[\begin{array}{cc}
-1 & 1 \\
1 & 0
\end{array}\right] \\
\mathrm{B}_{12}=\left[\begin{array}{ll}
0 & 0
\end{array}\right] ; \quad \mathrm{D}_{11}=\left[\begin{array}{l}
0 \\
0
\end{array}\right] ; \mathrm{D}_{12}=1 ; \mathrm{P}_{11}=-\left[\begin{array}{l}
0 \\
0
\end{array}\right] ; \mathrm{P}_{12}=-1 .
\end{gathered}
$$

Assuming that the required observer eigenvalues are -3 and -4 , then

$$
\mathrm{F}_{1}=\left[\begin{array}{cc}
-6 & -1 \\
6 & -1
\end{array}\right] ; \mathrm{K}_{1}=\left[\begin{array}{c}
-6 \\
5
\end{array}\right]
$$

The other observer parameters are as folows

$$
\mathrm{G}_{1}=\left[\begin{array}{c}
25 \\
-36
\end{array}\right] ; \mathrm{S}_{1}=\left[\begin{array}{cc}
-1 & 1 \\
1 & 0
\end{array}\right] ; \overline{\mathrm{R}}_{1}=\left[\begin{array}{c}
5 \\
-6 \\
1
\end{array}\right]
$$

## Example 2

Consider the following descriptor system [5]

$$
\left[\begin{array}{ccc}
1 & -1 & 0 \\
1 & -1 & 1 \\
-1 & 1 & 0
\end{array}\right] \dot{x}=\left[\begin{array}{ccc}
2 & -2 & 0 \\
2 & -1 & 0 \\
-2 & 2 & 1
\end{array}\right] x+\left[\begin{array}{l}
1 \\
0 \\
2
\end{array}\right] u ; y=\left[\begin{array}{lll}
2 & -1 & 1
\end{array}\right] x
$$

The slow and fast subsystems are as follows [5]

$$
\dot{x}_{1}=2 \mathrm{x}_{1}+\mathrm{u} ; \quad \mathrm{y}_{1}=2 \mathrm{x}_{1}
$$

and

$$
\left[\begin{array}{ll}
0 & 1 \\
0 & 0
\end{array}\right] \dot{x}_{2}=\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right] x_{2}+\left[\begin{array}{c}
-1 \\
3
\end{array}\right] ; y_{2}=\left[\begin{array}{ll}
1 & 1
\end{array}\right] x_{2}
$$

Clearly, the observer of order one is necessary only for fast subsystem. Then by direct calculation, we get $\mathrm{Q}_{2}=\left[\begin{array}{c}-0,7071 \\ 0,7071\end{array}\right] ; \mathrm{H}_{1}=0.7071 ; \mathrm{A}_{21}=-0.7071 ; \mathrm{A}_{22}=0.7071$ : $\mathrm{B}_{21}=-1 ; \mathrm{B}_{22}=3 ; \mathrm{D}_{21}=0.5 ; \mathrm{D}_{22}=0.5 ; \mathrm{P}_{21}=0,5 ; \mathrm{P}_{22}=0$.
Letting that the observer eigenvalue is -3 , the observer para,eters are as follows

$$
\mathrm{K}_{2}=2 ; \quad \mathrm{G}_{2}=1 ; \quad \mathrm{S}_{2}=-7 ; \quad \overline{\mathrm{R}}_{2}=\left[\begin{array}{l}
0 \\
1
\end{array}\right]
$$

## 4. CONCLUSIONS

A straightforward method to design reduced-order observers for slow and fast subsystems of the descriptor system is presented. The method is based on the singular value decomposition and the generalized inverses of matrices and does not presuppose the observer structure. It should be noted that, from theoretical point of view, under this decomposition, it is easily to desing reduced-order observers for the slow and fast subsystems and the sum of the observer order $\left[\left(n_{1}-\mathrm{d}\right)+\left(\mathrm{n}_{2}-1\right)\right]$ may be lower than that of one observer (n-rank C) [11]. However, from practical point of view, as in example 2, the calculation of the slow and fast subsystem outputs, $y_{1}$ and $y_{2}$ independently in terms of $y$, is sometimes very difficult. This problem may be overcommed by assuming a relation between $\mathrm{y}, \mathrm{y}_{1}$ and $\mathrm{y}_{2}$. This point need more investigation.
